Comprehensive User Operations & Manual Guide

QUICK OVERVIEW: This manual covers setup, AI vision document extraction, multi-section line range selection, target language configuration, question bank management, editing/deleting questions, and interactive quiz evaluation.

1. Executive Overview & Key Capabilities

The AI Quiz Generator is a web application designed to automatically convert knowledge documents, technical manuals, PDF files, and image scans into intelligent assessment quizzes. Using OpenAI LLM models and AI Vision OCR technology, it creates multiple-choice, essay, practical coding, and language vocabulary assessment questions.

Feature Module	Description & Utility
Multi-Format Ingestion	Supports .txt, .md, .docx, .pdf, .png, .jpg, .jpeg, .webp, .gif via Vision AI & document parsers.
Section Line Range Selector	Allows users to select specific line ranges/sections to avoid duplicate questions when updating files.
Bilingual Language Settings	Supports separate Question Language and Target Learning Language (e.g. learning Japanese via Vietnamese).
Question Editing & Deleting	Full Question Bank management with single-question editing, deletion, CSV import and export.

2. Initial Setup & API Key Configuration

To start generating questions, configure your OpenAI API Key. Your API key is stored securely in your local browser storage and communicated directly with OpenAI endpoints.

3. Document Upload & Vision AI Extraction

Upload your document or image via drag-and-drop or file browsing. For images and PDF files, AI Vision automatically performs high-accuracy OCR transcription. You can review, edit, and correct any transcribed text before generating questions.

4. Knowledge Section & Line Range Selection

When continuously developing a single knowledge document, uploading the entire file again could result in duplicate questions. The **Section & Line Range Selector** solves this problem by allowing you to mark exact line numbers or select non-contiguous ranges to turn into questions.

PRO TIP FOR CONTINUOUS STUDY: Use quick presets like 'Bottom Half (Newest)' or 'Last 50 Lines' when adding new notes to an existing knowledge document to extract questions only from newly added content.
